What is a stack effect in a house?

In the summer, the process reverses. Cold indoor air sinks into lower areas of the home, pulling hot outside air in from above. While stack effect is a natural phenomenon that occurs in every home, it becomes intensified when there are air leaks or insulation gaps throughout your home.

How does the stack effect affect heat?

Due to the stack effect, keeping the heat at bay can feel like a losing battle. The stack effect is a cyclical flow of air driven by differences between indoor and outdoor air densities and temperatures. There are three forces that move air through a house: HVAC equipment, wind, and the stack effect.

What is the stack effect and why is it important?

The stack effect, also known as the chimney effect, is a phenomenon that affects the quality of air, temperature, and energy efficiency of our homes. It is one of the most common reasons why people consider air sealing their property. Stack effect takes place inside our homes every day.

How can homeowners manage the stack effect?

With the right measures in place, homeowners can effectively manage the Stack Effect, maintaining a comfortable indoor environment while optimizing energy efficiency. The Stack Effect is a natural phenomenon driven by differences in indoor and outdoor temperatures that influences air movement within a home.

How does the stack effect affect your health and comfort?

Here is what you need to know about the stack effect and its impact on your health and comfort. Stack effect is centered around one basic concept -- hot air has a natural tendency to rise because it is less dense than cold air. In the winter, for example, warm air naturally rises to upper areas of your home.

How does a stack effect affect air quality?

During this period, the stack effect causes warmer air and your conditioned indoor air to rise. Cold air from outside seeps into your home's lower areas to fill up the void left by the warm air. For every cubic foot of warm air that leaks out, another cubic foot of cold air leaks in to replace it.
