

# How much electricity can photovoltaic panels generate in winter

Can solar panels generate electricity in the winter?

The short answer is yes! Solar panels can still generate electricity in the winter. However, data shows that energy generation can drop to an eighth of what it would be on a summer day, so choosing solar panels designed to optimise energy production all year round is essential.

How much electricity does a solar panel produce a month?

To give an idea of what that means, a standard 3.5 kilowatt (kW) solar panel system will produce around 362-kilowatt hours (kWh) of electricity per month during the summer. In winter, that drops to 52 kWh. Do solar panels still work in snowy weather?

Can solar panels be used in winter?

The best way of maximising electricity generation from solar panels in winter is to support the system with a solar battery energy storage system. This will enable storage of excess electricity generated during the summer for later use in the winter, and electricity produced in the day to be used at night.

Will solar panels generate enough electricity year-round?

Whether they'll generate enough electricity for your home year-round will depend on: if your solar panel system works in a power cut. It may be more realistic to think about whether you can be self-sufficient for the brighter parts of the year, and then top up your energy use from the grid at other times.

How do solar panels work in winter?

Winter can affect performance through shorter days, a low sun angle, and a cloud or snow cover. The cold temperature in winter can help enhance solar panel efficiency. You can improve panel performance in winter by adjusting the tilt, removing snow, debris, and obstructions and investing in microinverters. [How Do Solar Panels Work in the Winter?](#)

Does cold weather affect solar panels?

Cold weather doesn't affect solar panel performance (unless temperatures go below  $-40^{\circ}\text{C}$ ), since they operate on sunlight, which is still available in winter in the UK - albeit, at much lower levels than in the summer. This is one reason why solar panels generate less electricity in winter - the days are just shorter.
