

Solar panel systems include a few key components: a solar array, racking and mounting equipment, inverters, a disconnect switch, and, optionally, a solar battery. While you may be tempted to DIY your solar system, it's generally easiest and safest to hire a professional installer.

A solar PV module, or solar panel, is composed of eight primary components, each explained below:

1. Solar CellsSolar cells serve as the fundamental building blocks of solar panels. Numerous solar cells are combined to create a single solar panel.

The selection criteria for a solar panel are different i.e. space,warranty,efficiency,technology type,cost etc. Keep in mind that outputis the king when selecting a proper solar panel for residential solar power installation.

Make space for the solar panel accessories (solar inverter, cables and solar batteries, if desired), for instance in a plant room 4. Plan a day for installation 5. Erect the scaffolding (this can be done by your supplier or by a company you organise) 6. The solar panel mounts will be installed 7. The professionals will install the solar panels 8.

The installation phase of photovoltaic (PV) systems is a critical step that involves several key activities to ensure the system operates effectively and safely. Here's a more detailed look at what this phase entails:

Your solar array will be affixed to your property using racking and mounting systems. Rooftop solar panel systems will have a fixed mount system, keeping the panels stationary on your roof. All rooftop mounting systems serve the same functional purpose but can differ in how they're installed.
