What is thermal energy storage?

Thermal energy storage (TES) is the storage of thermal energy for later reuse. Employing widely different technologies, it allows surplus thermal energy to be stored for hours, days, or months. Scale both of storage and use vary from small to large - from individual processes to district, town, or region.

What are some sources of thermal energy for storage?

Other sources of thermal energy for storage include heat or cold produced with heat pumps from off-peak, lower cost electric power, a practice called peak shaving; heat from combined heat and power (CHP) power plants; heat produced by renewable electrical energy that exceeds grid demand and waste heat from industrial processes.

Does Siemens-Gamesa have a thermal storage system?

Siemens-Gamesa built a 130 MWh thermal storage near Hamburg with 750 °C in basalt and 1.5 MW electric output. A similar system is scheduled for Sorø, Denmark, with 41-58% of the stored 18 MWh heat returned for the town's district heating, and 30-41% returned as electricity. 2 output by 15% over 15 years.

What are the different types of thermal energy storage?

The different kinds of thermal energy storage can be divided into three separate categories: sensible heat, latent heat, and thermo-chemical heat storage. Each of these has different advantages and disadvantages that determine their applications. Sensible heat storage (SHS) is the most straightforward method.

Increase the overall energy efficiency of energy systems. Thermal energy storage is also a key part of peak shaving systems, where off-peak power is used to drive heat pumps that can produce heat or cold produced by cheaper electric power and waste heat from industrial sources in order to balance energy system loads. An inter-office energy storage project in collaboration with the Department of Energy's Vehicle Technologies Office, Building Technologies Office, and Solar Energy Technologies Office to provide foundational science enabling cost-effective pathways for optimized design and operation of hybrid thermal and electrochemical energy storage systems.

Thanks to the \$370+ billion Inflation Reduction Act (IRA) of 2022, thermal energy storage system costs may be reduced by up to 50%. Between the IRA's tax credits, deductions, rebates and more, a thermal energy storage system may cost significantly less than a conventional system.
