Are CIGS-based lightweight and flexible photovoltaic devices possible?

This communication presents the prospects of Cu (In,Ga)Se<sub>2</sub> (CIGS)-based lightweight and flexible photovoltaic devices. The current status of flexible CIGS minimodules with photovoltaic efficiency values greater than 18% and future directions to enhance their efficiency values toward >20% are discussed.

Will CIGS thin-film solar panel technology keep on growing?

It is expected that CIGS thin-film solar panel technology will keep on growing at a compound annual growth rate (CAGR) of 6.97% from 2019 to 2027. Currently, there are several CIGS solar panel manufacturers.

Do CIGS solar minimodules have high photovoltaic efficiency?

In this communication, recent developments in the photovoltaic performance of lightweight and flexible monolithically interconnected CIGS solar minimodules are presented. The issues regarding the development of CIGS solar cells and modules with higher photovoltaic efficiency values are also discussed.

Can CIGS minimodules be fabricated using PHL techniques?

The lightweight and flexible CIGS minimodules with photovoltaic efficiency values greater than 18%, shown in the previous section, were also fabricated using MS for P2 and P3 processes. It may be challenging to apply PhL techniques to fabricate large-area modules in practical and industrial production.

What is CIGS technology?

CIGS technology can be used to manufacture flexible PV modules. These modules can be adapted to odd shapes, curved rooftops, or the sides of buildings, providing the ability to generate power with PV modules that adapt to the shape of the surface. CIGS alongside and CdTe technology can be used for portable applications.

Are CIGS solar panels better than c-Si solar panels?

There is also an important environmental advantage to CIGS thin-film solar panel technology compared to crystalline silicon (c-Si) ones. Manufacturing c-Si PV modules produce equivalent pollution of 50-60 g of CO<sub>2</sub> /kWh, while a CIGS solar panel only produces 12-20 g of CO<sub>2</sub> /kWh, which is similar to wind power that produces 10-12 g of CO<sub>2</sub> /kWh.

Alongside glass, the photovoltaic CIGS semiconductor stack can be deposited onto flexible substrates, such as stainless steel and polyimide films. These can then be incorporated into PV modules that are lightweight, flexible, and robust - ideal for electric cars, buses, trucks, trains, and membrane roofing structures.

Alongside glass, the photovoltaic CIGS semiconductor stack can be deposited onto flexible substrates, such as stainless steel and polyimide films. These can then be incorporated into PV modules that are lightweight, flexible, and robust ...

However, the costs for CIGS coating materials, which correspond to the wafer in a c-Si module, are significantly lower than those for a wafer. Could this be a motive for the actions that have...

CIGS is a high-performance PV technology, both in terms of relative conversion efficiency and absolute energy yield. There is a long track record for CIGS in both utility-scale and rooftop applications - including in some of the world's most demanding climates. At utility scale, CIGS PV has a proven track record and has demonstrated . superior

Scientists from Japan's National Institute of Advanced Industrial Science and Technology have investigated the prospects for lightweight, flexible PV devices based on copper, indium, gallium and...

In comparison with the weight of conventional photovoltaic solar modules in the range of 10-20 kg m<sup>-2</sup>, the weight of our CIGS minimodules fabricated using 0.2-mm-thick flexible ceramic...

o Increasing module efficiency would drive down system costs, a major contributor to LCOE o Reducing degradation rate from -0.96%/yr assumed here to -0.5%/year could decrease CIGS LCOE by ~0.5 ¢/kWh, depending on the module o SAM may underestimate CIGS energy production according to industry interviews.

The bifacial monocrystalline modules showed the highest normalized yield compared to conventional poly-Si and mono-Si modules, glass-glass poly-Si, and CIGS and CdTe thin-film modules. The most significant causes of power loss ...

o Increasing module efficiency would drive down system costs, a major contributor to LCOE o Reducing degradation rate from -0.96%/yr assumed here to -0.5%/year could decrease CIGS ...

CIGS thin-film solar panels generate power like other PV modules under the photovoltaic effect. The CIGS solar cell created with CIGS and Cadmium sulfide (CdS) for the absorber, generates power by absorbing ...

The light weight of CIGS solar panels is great for applications where there is a maximum weight limit. The weight for PERC and TOPCon PV modules can go anywhere from 18 kg up to 33 kg, but some CIGS thin-film ...

CIGS thin-film solar panels generate power like other PV modules under the photovoltaic effect. The CIGS solar cell created with CIGS and Cadmium sulfide (CdS) for the absorber, generates power by absorbing photons from incoming sunlight, producing electrons that travel from the n-side to the p-side of the junction in the absorber layer.

The light weight of CIGS solar panels is great for applications where there is a maximum weight limit. The weight for PERC and TOPCon PV modules can go anywhere from 18 kg up to 33 kg, but some CIGS thin-film solar panels barely weigh around 5 kg. This makes them an excellent option for homes with roof

weight limitations to enjoy solar energy ...

On the basis of the fundamental work of IPE the ZSW has developed the technologies for all process steps on a module size of  $30 \times 30 \text{ cm}^2$  on glass substrates. Average module efficiencies are well above 10%, with a tendency to improve efficiency to a maximum of 12.7% on a  $30 \times 30 \text{ cm}^2$  module area.
